## **Topic: Proportion**

Topic/Skill	Definition/Tips	Example
1. Direct Proportion	If two quantities are in direct proportion, as one increases, the other increases by the same percentage.	$y \land y = kx$
	If y is directly proportional to x, this can be written as $y \propto x$	x
	An equation of the form $y = kx$ represents direct proportion, where k is the constant of proportionality.	
2. Inverse Proportion	If two quantities are inversely proportional, <b>as one increases</b> , the <b>other decreases</b> by the <b>same percentage</b> .	$y = \frac{k}{x}$
	If y is inversely proportional to x, this can be written as $y \propto \frac{1}{x}$	x
	An equation of the form $y = \frac{k}{x}$ represents inverse proportion.	÷
3. Using	<b>Direct</b> : $\mathbf{y} = \mathbf{k}\mathbf{x}$ or $\mathbf{y} \propto \mathbf{x}$	p is directly proportional to q.
proportionality		When $p = 12$ , $q = 4$ .
formulae	<b>Inverse:</b> $\mathbf{y} = \frac{k}{x}$ or $\mathbf{y} \propto \frac{1}{x}$	Find p when $q = 20$ .
	1. Solve to find k using the pair of values	1. p = kq
	in the question.	$12 = k \times 4$
	2. <b>Rewrite the equation</b> using the k you	so k = 3
	have just found.	2 - 2 - 2 - 3 - 3 - 3 - 3 - 3 - 3 - 3 -
	3. Substitute the other given value from	2. $p = 3q$
	the question in to the equation to <b>find the missing value</b> .	3. $p = 3 \times 20 = 60$ , so $p = 60$
4. Direct	Graphs showing <b>direct proportion</b> can be	Direct Proportion Graphs
Proportion with powers	written in the form $y = kx^n$ Direct proportion graphs will always start at the origin.	$ \begin{array}{c}                                     $
5. Inverse	Graphs showing <b>inverse proportion</b> can be	Inverse Proportion Graphs
Proportion with powers	written in the form $y = \frac{k}{x^n}$	
	Inverse proportion graphs will never start at the origin.	$   \begin{array}{c}     y = \frac{3}{s^2} \\     4 \\     y = \frac{0.5}{s^2} \\     -2 \\   \end{array} $
